

TEMPORARY LATCHES

Abstract of the Disclosure

5 The present invention is a temporary latch for use in an installed door until
the permanent latch for the door can be installed. The temporary latch consists
of two pieces, i.e. a handle portion with tabs and a tongue portion with slots. The
two pieces removably secure together within a door latch opening provided in the
door by rotating the tongue portion so that the tabs of the handle portion are
10 reversibly locked in the slots of the handle portion. The handle portion is
provided with a ring for grasping and a compressible arm that retracts causing
the tongue portion to be withdrawn into the door latch opening as the door is
being closed and when the door is being unlocked from its door frame.
